## Executive Summary

## Content

Paradigm Transportation Solutions Limited (Paradigm) has been requested to undertake a Transportation Impact, Parking and Travel Demand Management Study for proposed residential development at 6349 Regional Road 25 in the Town of Milton.

The subject site is located in the northeast corner of the intersection of Regional Road 25 and Louis Saint Laurent Avenue. The proposed development consists of three (3) six-storey apartment buildings with a total of 276 units. Vehicular access to the development is proposed via two right-in/right-out driveways to Regional Road 25 and Louis Saint Laurent Avenue. A total of 404 spaces ( 383 spaces plus 21 tandem spaces) are provided.

## Conclusions

## Transportation Impact Study

This study evaluated the impacts associated within the construction of 276 residential units in three 6-storey buildings on a parcel of land bounded by Regional Road 25 north of Louis Saint Laurent. Access to the site is proposed via two right-in/right-out driveway to Regional Road 25 and Louis Saint Laurent Avenue. Overall the proposed development is projected to generate approximately 99 new vehicle trips during the weekday AM peak hour and 119 new vehicle trips during the weekday PM peak hour.

Detailed traffic analysis was conducted for each of the study area intersections under Base conditions, 2024, and 2029 Background and Total conditions.

The new traffic forecast to be added by full-build out of the development to the study area roadways results in relatively small impacts at the various study intersections. The analysis has further determined that the proposed driveways to Regional Road 25 and Louis Saint Laurent Avenue will operate at LOS C or better during the weekday peak periods under the 2024 and 2029 Total conditions.

With the proposed development having access through a right in/out driveway to Regional Road 25, it is suggested that a northbound right turn taper be constructed to allow right-turning traffic to safely slow down before making the turn from the higher speed roadway, without interfering with through traffic on Regional Road 25.

It is acknowledged that deficiencies currently exist at the Regional Road 25 and Louis Saint Laurent intersection and they can be expected to persist in the future with anticipated growth in traffic, independent of the development. As outlined in the capacity analysis summary tables, impacts to peak hour
operations at the intersection of Regional Road 25 at Louis Saint Laurent Avenue between future background and total traffic conditions are expected to be relatively minor as a result of the proposed development. As a result, there are no recommended improvements at Regional Road 25 and Louis Saint Laurent Avenue necessary to accommodate the proposed development.

## Parking Study

The proposed site provides for a total of 404 parking spaces (383 spaces plus 21 tandem spaces); equating to a parking rate of 1.39 parking spaces per unit (resident and visitor). The parking requirement under Zoning By-Law 2009-189 stipulates a parking supply of 483 spaces; equating to a parking rate of 1.75 spaces per unit (resident and visitor). The proposed parking supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) does not meet the Zoning requirements as a shortfall of 100 spaces is noted, however, the 1.75 spaces per unit is much higher than many comparable municipalities.

To provide further support that the proposed supply of 1.39 spaces per unit will not result in a shortfall of parking, projected peak parking demand for the site has been estimated based on compiled parking surveys as well as industry standard rates contained within the ITE Parking Generation. Based on these methodologies, forecast parking demand for the proposed development is projected to be 362 parking spaces ( 1.31 spaces per unit).

Many existing Zoning By-Law parking requirements are antiquated and require updating to conform and reflect current polices and best practices. Many municipalities recognize the oversupply of parking and are updating the zoning requirement to reflect. Key municipalities that have recognized this include Town of Oakville, City of Burlington, and City of Kitchener. These municipalities have undertaken a comprehensive review of parking requirements and recognized that changes are required to meet policy objectives.

The Town of Milton requires on average 23\% more parking to be provided for this development than would be required by the City of Burlington or Town of Oakville that have adopted new parking requirements. Through the incorporation of unbundled parking spaces, the proposed supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) is sufficient.

The transition from an automobile-dependent environment to one that is transit-supportive will require strategies to assist in shifting modal split and enabling the emergence of a more pedestrian-friendly transit-supportive environment. The over provision of free or low-cost parking creates areas that are dominated by parking infrastructure can have a negative impact on ridership and the pedestrian environment as well as providing an incentive for single-occupant vehicle use.

Based upon the recent research and best practices being implemented by municipalities, a reduced Parking Supply is one of the most effective TDM
measure available to reduce vehicle travel. The role of parking management is a key element to helping Milton meet its trip reduction goals. If free and unregulated parking is provided, there is little incentive for many residents and visitors to use alternative modes of transportation.

Overall, the forecasted demand provides a statistically valid justification that the proposed parking supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) is sufficient for the proposed development program.

## Travel Demand Management

The site plan proposes several TDM measures that include:

- Sidewalk connections linking the building's primary entrance to the municipal roadway along Louis Saint Laurent Avenue and Regional Road 25 are proposed;
- Minimum bicycle parking spaces are provided based on the Town's Zoning requirement; and
- Convenient access to the existing transit network is provided with transit stops located at the intersection of Regional Road 25 and Louis Saint Laurent Avenue.

Additional measures that are currently not included on the site plan that could be considered to further help promote and encourage TDM include:

- Milton Transit to upgrade the existing transit stops with concrete landing pads and shelters.
- The applicant consider providing preloaded presto passes to residents.
- The site operator monitor the on-site bicycle parking supply to ensure and appropriate amount of bicycle parking is provided.
- The site operator monitor the long-term desire lines, if any, created by the erosion caused by pedestrians crossing the site's landscaped areas. Should desire lines form there may be an opportunity to adjust the site's landscaping to encourage use of the designated on-site pedestrian sidewalks.
- Based on the City of Kitchener's TDM Checklist, a potential reduction of 53 parking spaces could be realized with the additional measures incorporated.

## Recommendations

Based on the findings of this study, it is recommended that:

- That the Region of Halton and Town of Milton monitor the future traffic volumes at the intersection of Regional Road 25 and Louis Saint Laurent Avenue when they Boyne Secondary Plan area is built out to confirm the lane geometry and signal timing phases; and
- A northbound right turn taper be provided along Regional Road 25 at the proposed driveway to provide a safe right-turn maneuver based on the potential for higher speeds on Regional Road 25.
- Flexible delineators (to act as a median) be installed by the Applicant on Regional Road 25 extending from the Louis Saint Laurent Avenue intersection to 45 metres north of the proposed Site Driveway to prohibit left-turns in and out of the site.

## 1 Introduction

### 1.1 Overview

Paradigm Transportation Solutions Limited (Paradigm) has been requested to undertake a Transportation Impact, Parking and Travel Demand Management Study for proposed residential development at 6349 Regional Road 25 in the Town of Milton.

The subject site is located in the northeast corner of the intersection of Regional Road 25 and Louis Saint Laurent Avenue as shown in Figure 1.1. The proposed development consists of three (3) six-storey apartment buildings with a total of 276 units. Vehicular access to the development is proposed via two right-in/right-out driveways to Regional Road 25 and Louis Saint Laurent Avenue. A total of 404 parking spaces ( 383 spaces plus 21 tandem spaces) are provided.

Pre-study consultation was undertaken with Halton Region and the Town of Milton via email in June 2019. Appendix A contains the pre-study correspondence and the comments received from the Region of Halton.

Figure 1.1

### 1.2 Purpose and Scope

This study determines the impacts of the additional traffic generated by the expansion on the surrounding road network and the remedial measures necessary, if any, to accommodate future traffic in a satisfactory manner. The scope of this study includes:

- Assessments of the current traffic and site conditions within the study area;
- Estimates of background traffic growth;
- Estimates of the additional traffic generated by the planned expansion;
- Analyses of the impact(s) of the future traffic on the surrounding road network for the 2024 horizon year (five years from date of study is commissioned) and 2029 horizon year (ten-year horizon);
- Recommendations necessary to mitigate the site generated traffic in a satisfactory manner;
- An estimate of the parking demand generated by the expansion and establishment of the number of on-site parking spaces that should be provided to support the demand; and
- Identification and recommendation of Transportation Demand Management (TDM) measures specific to this site.

The study has been completed using Halton Region Transportation Impact Study Guidelines ${ }^{1}$.

### 1.3 Study Area Intersections

The intersections that have been identified for assessment in this study and approved by the Town of Milton and Halton Region staff are as follows:

- Regional Road 25 and Louis Saint Laurent Avenue (signalized); and
- Up to two (2) site driveways (assumed to be unsignalized).

[^0]
## 2 Existing Conditions

### 2.1 Roadway Network

Regional Road 25 and Louis Saint Laurent Avenue are the roadways in the study area that will be most impacted by the proposed development. The general characteristics of each roadway are described as follows:

- Regional Road 25 is a major north-south undivided arterial roadway within the study area under the jurisdiction of Halton Region. It has a four-lane urban cross-section with auxiliary turning lanes at its signalized intersection with Louis Saint Laurent Avenue. The posted speed limit is 70 kilometres per hour. Regional Road 25 is scheduled for widening to a six-lane cross section in 2027.
- Louis Saint Laurent Avenue is an east-west arterial roadway within the study area under the jurisdiction of the Town of Milton. It has a four-lane urban cross-section with auxiliary left-turn lanes at its signalized intersection with Regional Road 25. There is a raised centre median from Regional Road 25 to the Sixteen Mile Creek bridge. The posted speed limit is 60 kilometres per hour.

The existing lane configurations and traffic control are shown in Figure 2.1.

### 2.2 Transit Service

Milton Transit operates one route adjacent to the site. Details of the transit route are as follows:

- Route 9 Ontario South: runs in a north-south direction from the Milton GO Station to the residential area at the intersection of Regional Road 25 and Britannia Road West. Service runs from 05:20 AM to 10:11 PM with headways generally from 20 to 60 minute headways Monday through Friday. Saturday service is provided from 7:10 AM to 7:40 PM with headways generally every 60 minutes.

The closest transit stops are located on both sides of Regional Road 25 at the Louis Saint Laurent Avenue intersection. The transit stops are identified by signage. There are no passenger facilities such as landing pads, benches or shelters at the two transit stops.

Figure 2.2 shows the location of the transit routes within the study area.

paradigm
Existing Transit Network
Figure 2.2

### 2.3 Pedestrian and Cycling Environment

### 2.3.1 Pedestrian

There are asphalt multi-use trails on either side of Regional Road 25 north of Louis Saint Laurent Avenue. The west side multi-use trail veers away from Regional Road 25 to access the Milton Community Sports Park. South of Louis Saint Laurent Avenue there is a sidewalk on the east side of Regional Road 25. Asphalt multi-use trails are on both sides of Louis Saint Laurent Avenue west of Regional Road 25. The multi-use trail continues on the north side of Louis Saint Laurent Avenue east of Regional Road 25.

At the signalized intersection of Regional Road 25 and Louis Saint Laurent Avenue there are pedestrian signal heads with push buttons and crosswalk markings on all approaches.

Walk Score is an online tool that assigns a numerical walkability score between 0 and 100. Walk Score ranks communities nationwide based on how many businesses, parks, theatres, schools, and other common destinations are within walking distance. The subject site is noted to score a Walk Score ${ }^{2}$ of 34 and is considered "Car Dependent," which means that most errands require a vehicle.

### 2.3.2 Cycling

On-street cycling lanes are provided on Louis Saint Laurent Avenue within the study area. No on-street cycling lanes are provided on Regional Road 25.

### 2.4 Traffic Volumes

To assess intersection operations, turning movement counts (TMC) are used to quantify the movement of vehicles. Existing traffic counts at an intersection or on a road section forms the foundation for analysis. The traffic counts are usually collected during peak periods at an intersection for use in level of service analysis.

Paradigm conducted an 8-hour TMC on June 6, 2019 at the study area intersection. Figure 2.3 illustrates existing weekday AM and PM peak hour traffic volumes at the study area intersections.

Appendix B contains the turning movement count data.

[^1]

## Existing Traffic Volumes

[^2]Figure 2.3

### 2.5 Traffic Operations

Intersection level of service (LOS) is a recognized method of quantifying the average delay experienced by drivers at intersections. It is based on the delay related to the number of vehicles desiring to make a movement, compared to the estimated capacity for that movement.

The capacity is based on several criteria including but not limited to, vehicle headways, intersection geometry, vehicle composition, opposing traffic flows, and for signalized intersections, signal timing. Capacity is evaluated in terms of the ratio of demand flow to capacity with a at capacity condition represented by a volume-to-capacity ratio of 1.00 (i.e. volume demand equals capacity).

Table 2.1 summarizes the level of service criteria for signalized and stop controlled intersections. The highest possible rating is LOS A, under which the average delay is equal or less than 10.0 seconds per vehicle. When the average delay exceeds 80 seconds at signalized intersections, 50 seconds at unsignalized intersections or when the $\mathrm{v} / \mathrm{c}$ ratio is greater than 1.00 , the movement is classed as LOS F and remedial measures are usually implemented if feasible. LOS E is generally used as a guideline for the determination of road improvement needs on through lanes, while LOS F may be acceptable for left-turn movements at peak times, depending on capacity and safety considerations. It is also recognized that the guidelines for determining when improvements are necessary can vary in different municipalities.

TABLE 2.1: VEHICLE LEVEL OF SERVICE DEFINITIONS

| LOS | Signalized <br> Intersections Average <br> Total Delay (sec/veh) | Unsignalized <br> Intersections Average <br> Total Delay (sec/veh) |
| :---: | :---: | :---: |
| A | $<=10$ | $<=10$ |
| B | $>10 \&<=20$ | $>10 \&<=15$ |
| C | $>20 \&<=35$ | $>15 \&<=25$ |
| D | $>35 \&<=55$ | $>25 \&<=35$ |
| E | $>55 \&<=80$ | $>35 \&<=50$ |
| F | $>80$ | $>50$ |

The operations of the study area intersections were evaluated under existing traffic volumes using Synchro 9 / SimTraffic 9 and HCM 2000 procedures. The intersection analysis considered the following measures of performance:

- The LOS for each turning movement. LOS is based on the average control delay per vehicle;
- The volume to capacity ratio for each intersection; and
- $95^{\text {th }}$ percentile queue length ( m ).

The Halton Region TIS Guidelines identify the following thresholds for critical movements at intersections:

- Volume to capacity ratios for overall intersection operations, through movements or shared through/turning movements that operate at 0.85 or greater for signalized intersections;
- Volume to capacity ratios for exclusive turning movements that operate at 0.95 or greater for signalized intersections;
- Level of service based on average delay per vehicle or individual movement is LOS D or greater for unsignalized intersections; and
- Estimated $95^{\text {th }}$ percentile queue lengths exceed available turning lane storage at both signalized and unsignalized intersections.

Table 2.2 summarizes the results of the analysis for the existing weekday AM and PM peak hour intersection operations. The results of the analyses indicate that the intersection of Regional Road 25 and Louis Saint Laurent Avenue is currently operating with acceptable overall level of service during the AM and PM peak hours with the following critical movements:

- The eastbound through movement is operating with LOS E and volume capacity ratio of 1.02 during the AM peak hour;
- The westbound left-turn movement is operating with LOS F and volume to capacity ratio of 1.09 during the AM peak hour;
- The southbound through movement is operating at LOS D with volume to capacity ratio of 0.99 during the AM peak hour; and
- The northbound through movement is operating at LOS D with volume to capacity ratio of 0.95 during the PM peak hour.

Appendix B contains the detailed Synchro output.

## 3 Development Concept

### 3.1 Development Description

The subject site is located in the northeast corner of the intersection of Regional Road 25 and Louis Saint Laurent Avenue. The proposed development is to consist of three six-storey apartment buildings with a total of 276 units.

Vehicular access to the development is via two right -in/right-out driveways, one to Regional Road 25 and one to Louis Saint Laurent Avenue. In the prestudy consultation with the Region of Halton (Appendix A), the Region specified access to Regional Road 25 would not be permitted to operate as a full -moves driveway. It would have to operate as a right-in/right-out only with a raised centre median on Regional Road 25 to prohibit left-turns in and out of the driveway. With an already existing raised centre median on Louis Saint Laurent Avenue, both driveways would have to operate as right-in/right-out only. Future residents of the development would have to adjust their trips to/from the site accordingly.

To prohibit cut-through traffic, traffic calming measures such as speed humps could be placed on the internal drive aisles. In addition, an enhanced pedestrian realm (brightly lit and visible sidewalks, raised crosswalks) will also reduce vehicle speeds on site and limit the potential for cut-through traffic.

A total of 404 parking spaces ( 383 spaces plus 21 tandem spaces) are to be provided on site.

Figure 3.1 illustrates the site concept plan.

### 3.1.1 Sight Distance

Both Regional Road 25 and Louis Saint Laurent Avenue are relatively flat and straight with no horizontal or vertical sightline issues.

Based on the Transportation Association of Canada (TAC) guidelines, the minimum stopping sight distance for a road with a design speed of 80 kilometres per hour is 130 metres $^{3}$, the minimum sight distance for a left-turn from stop is 170 metres $^{4}$, and the minimum sight distance for a right-turn from stop is 145 metres $^{5}$. The minimum stopping sight distance for a road with a design speed of 70 kilometres per hour is 105 metres, the minimum sight distance for a left-turn from stop is 150 metres, and the minimum sight distance for a right-turn from stop is 130 metres.

Sight distance from both proposed driveways exceed 150 metres in all directions. Sight distance should not be a concern at the proposed connections to the subject site. Appropriate daylight triangles should be provided at the site driveways.

### 3.2 Site Generated Traffic

The Institute of Transportation Engineers (ITE) Trip Generation ${ }^{6}$ methods predict the site trip generation. Land Use Code 221 (Multifamily Housing [Mid-Rise]) was used to estimate the site's trip generation. Table 3.1 summarizes the estimated trip generation of the subject site. It is estimated to generate approximately 99 AM peak hour trips and 119 PM peak hour trips. No reductions were made to account for modal split (transit and active transportation). As such, the estimated trip generation is expected to be conservative.

TABLE 3.1: ESTIMATED TRIP GENERATION

| ITE Land Use | Units | AM Peak Hour |  |  |  | PM Peak Hour |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | In | Out | Total | Rate | In | Out | Total |  |
| 221 Multifamily Housing (Mid-Rise) |  | 0.36 | 25 | 74 | 99 | 0.44 | 74 | 47 | 119 |

[^3]
### 3.3 Trip Distribution and Assignment

The site generated trips were assigned to the road network based on the existing distribution of traffic at the study area intersections. Table 3.2 summarizes the estimated site trip distribution.

TABLE 3.2: ESTIMATED TRIP DISTRIBUTION

| Direction | Route | AM Peak Hour |  | PM Peak Hour |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Inbound | Outbound | Inbound | Outbound |
| North | Regional Road 25 | 25\% | 26\% | 24\% | 29\% |
| South |  | 25\% | 41\% | 43\% | 25\% |
| East | Louis Saint Laurent Avenue | 24\% | 16\% | 18\% | 19\% |
| West |  | 26\% | 17\% | 15\% | 27\% |
| Total |  | 100\% | 100\% | 100\% | 100\% |

Figure 3.2 illustrates the trip assignment to be generated by the development.

Site Generated Traffic Volumes

## 4 Evaluation of Future Traffic Conditions

The assessment of future conditions in this section includes the following components necessary to assess the traffic implications on the adjacent road network:

- Future background traffic estimates;
- Level of service analysis for background traffic (pre-development);
- Future total traffic estimates; and
- Level of service analysis for total traffic (post-development).

### 4.1 Forecast Forecasts

### 4.1.1 2024 Background Forecasts

The future background traffic volumes have been estimated by applying site traffic from near by developments. The developments include the Boyne Secondary Plan. The PM peak hour Boyne Secondary area site traffic was provided by the Region with the request that the volumes be reversed for the AM peak hour.

Weekday AM and PM peak hour site generated traffic from the east side of the 6349 Regional Road $25^{7}$ development is included in the background traffic forecasts as well.

All background development traffic assignments are provided in Appendix D. Figure 4.1 illustrates the forecast year 2024 background traffic volumes for the weekday AM and PM peak hours.

### 4.1.2 2024 Total Forecasts

The 2024 future total traffic volumes forecast to occur includes the future background traffic volumes and the site generated traffic volumes.

Figure 4.2 illustrates the forecast year 2024 total traffic volumes for the weekday AM and PM peak hour.

[^4]

### 4.1.3 2029 Background Forecasts

The future background traffic volumes have been estimated by applying a growth rate of $2 \%$ compounded per annum to the 2024 background traffic volumes. Figure 4.3 illustrates the forecast year 2029 background traffic volumes for the weekday AM and PM peak hours.

### 4.1.4 2029 Total Forecasts

The 2029 future total traffic volumes forecast to occur includes the future background traffic volumes and the site generated traffic volumes.

Figure 4.4 illustrates the forecast year 2029 total traffic volumes for the weekday AM and PM peak hour.

2029 Background Traffic Volumes

paradigm

### 4.2 Operational Analysis

Level of service analyses were conducted using Synchro 9 with HCM 2000 procedures for the weekday AM and PM peak hour conditions at the study area intersections using the total background traffic forecasts with existing signal timings splits and cycle lengths. Under the 2029 horizon, it is assumed that the planned widening on Regional Road 25 from four-lane to six-lanes will be completed.

Table 4.1 and Table 4.2 summarizes the capacity analyses for the study area intersections for the AM and PM peak hours, respectively. The capacity analyses results are included in Appendix E.

The analyses indicate that the introduction of the site generated traffic will not impact the study area intersections. The following sub-sections outlines the operations of the study area intersections.

### 4.2.1 Regional Road 25 at Louis Saint Laurent Avenue

The results of the analyses indicate that the intersection of Regional Road 25 at Louis Saint Laurent Avenue is forecast to operate with poor level of service under 2024 Background and Total Traffic conditions during the AM and PM peak hours. Several individual turning movements are forecast to operate at LOS E/F and volume to capacity ratios exceeding capacity.

Under 2029 Background and Total Traffic conditions, with the proposed widening of Regional Road 25 assumed, operations do improve slightly, although the intersection is still considered at-capacity. The Town and Region should consider further improvement options to assist in mitigating the capacity constraints.

### 4.2.2 Regional Road 25 at Site Driveway

The right-in/right-out only intersection of Regional Road 25 and the Site Driveway is forecast to operate at acceptable level of service during the AM and PM peak hours.

### 4.2.3 Louis Saint Laurent Avenue at Site Driveway

The right-in/right-out only intersection of Louis Saint Laurent Avenue and the Site Driveway is forecast to operate at acceptable level of service during the AM and PM peak hours.

### 4.4 Remedial Measures

It is acknowledged that deficiencies currently exist at the Regional Road 25 and Louis Saint Laurent intersection and they can be expected to persist in the future with anticipated growth in traffic, independent of the development. As outlined in the capacity analysis summary tables, impacts to peak hour operations at the intersection of Regional Road 25 at Louis Saint Laurent Avenue between future background and total traffic conditions are expected to relatively minor as a result of the proposed development.

As a result, there are no recommended improvements at Regional Road 25 and Louis Saint Laurent Avenue necessary to accommodate the proposed development.

### 4.4.1 Right Turn Lanes

The proposed driveway connections to Regional Road 25 and Louis Saint Laurent Avenue was assessed to determine if the projected traffic volumes warrant installation of a right turn lane along the two roadways.

Although right turns are generally made more efficiently than left turn movements, exclusive right turn lanes are often provided, for many of the same reasons that left turn lanes are provided.

MTO guidelines (Geometric Design Standards for Ontario Highways) note that right turn lanes or tapers may be considered where right turn volumes exceed 60 vehicles per hour (vph) and where right turning vehicles create a hazard or reduce capacity at the intersection. The forecast right turn movement at Regional Road 25 and the Site Driveway indicates a right turn movement of 43 vehicles per hour is projected. At the Louis Saint Laurent Avenue and the Site Driveway, the forecast right-turn movement of 31 vehicles per hour is projected.

With Regional Road 25 having potential for higher vehicle speeds, it is suggested that a northbound right turn taper be constructed to allow rightturning traffic to safely slow down before making the turn, without interfering with through traffic. The right turn taper should conform to the design guidelines outlined in the Transportation of Canada Geometric Design Guide for Canadian Roads ${ }^{8}$. Based on a review of these standards, the northbound right turn taper along Regional Road 25 at the proposed driveway should consist of a 75-metre taper with 30 metre recover taper.

As road capital projects are proposed along Regional Road 25, it is recommended that flexible delineators (to act as a median) be installed by the Applicant on Regional Road 25 extending from the Louis Saint Laurent Avenue intersection to 45 metres north of the proposed Site Driveway to prohibit left-turns in and out of the site.

[^5]
### 4.5 Access and Circulation Review

As requested by the Town of Milton, a swept path analysis was conducted for the proposed internal driveway network.

The vehicle movements were examined using a CAD base file of the development plan dated 17 April 2020. The swept path analysis was conducted to examine the on-site maneuverability of typical design vehicles expected to utilize the site; Heavy Single Unit (HSU), Halton Front End and, Halton White Goods Vehicle. Appendix F provides the vehicle manoeuvring analysis, as well as the profile and dimensions of the design vehicles.

The AutoTURN analyses indicate that the design vehicles do not have any difficulty entering the development through the proposed driveway connections Louis St. Laurent Avenue and Regional Road 25 nor any difficultly circumnavigating the internal roadway. The AutoTURN swept path analysis confirms the large design vehicles will function adequately.

## 5 Parking

### 5.1 Purpose and Scope

The purpose of this study is to determine if the proposed number of on-site parking spaces will adequately accommodate the expansion; thereby supporting a reduction in the number of parking spaces required under the current Zoning By-law parking requirements.

Information collected as part of an on-site parking survey will be used in determining the anticipated parking demands of the site as this is expected to be the best predictor of the current and future parking demands for the site.

The proposed on-site parking consists of 87 parking spaces on surface and 296 spaces plus 21 tandem spaces underground on one level for a total of 404 spaces ( 1.39 spaces per unit).

### 5.2 Zoning By-Law

The Town of Milton Zoning By-law 016-2014 was referenced to determine the parking requirements for the proposed development. The following parking provisions are required under the current By-law for residential land uses:

- Apartment Buildings: 1.50 parking spaces per unit plus 0.25 parking spaces for visitor parking in a designated visitor parking area.

Based on the above, the total By-Law parking requirement for the site is 483 spaces. With a proposed parking supply of 404 spaces ( 383 spaces plus 21 tandem spaces), there will be a deficiency of 100 parking spaces (or about 20\%) as shown in Table 5.1.

TABLE 5.1: ZONING BY-LAW PARKING REQUIREMENTS

| Use | Units | Parking <br> Rate | Spaces <br> Required |
| :--- | :---: | :---: | :---: |
| Apartment Buildings | 276 | 1.50 per unit | 414 |
| Visitor | 276 | 0.25 per unit | 69 |
| Total Parking Required |  | $\mathbf{1 . 7 5}$ per unit | $\mathbf{4 8 3}$ |

### 5.3 Other Jurisdictions

Parking standards are increasingly seen as an instrument of planning policy, and parking ratios are now looked at as having a main role in determining car use.

Parking ratios have existed in most cities since at least the 1950's and have often been amended incrementally by various means over time.
Consequently, it is not surprising to find that municipalities are often unable to trace the justification or reasoning behind some of the older parking ratios found in their current Zoning By-laws.

Given that parking standards reflect an "average" condition, they will rarely prescribe the number of parking spaces to match the parking demands of any individual development project exactly. The empirical challenge is to develop some understanding of the range over which parking demand for a given use may vary, and the policy question is where in that range should the parking standard or ratio be set.

Other municipalities with Halton Region are recognizing the advantages of parking rations in support of broader Official Plan objectives. For example, if this project were to be located within the North Oakville, a parking rate of 1.45 parking spaces per unit would be the maximum ratio accepted. In contrast to generic minimum parking requirements, North Oakville provides maximum limits to restrict the total number of spaces that can be
constructed rather than establish a minimum number. The City of Burlington has recently undertaken a parking standard review that determined lower parking rates for apartment buildings should be applied. If the project were to be located within the City of Burlington, a parking rate of 1.40 parking spaces per unit would be accepted.

Parking regulations under Zoning By-law 016-2014 are on average 23\% higher than neighbouring municipalities within Halton Region that have adopted new standards based on broader Official Plan objectives that recognizes the correlation between supportive land uses and lower automobile ownership. In addition, attitudes towards automobile ownership and the role it plays in an urban lifestyle are changing in the eyes of both consumers and policy makers, and lower parking regulations reflect this. As parking regulations are an attempt to provide supply to meet demand,
regulations which require lower supply for future buildings are an indication that future demand is likely to be lower.

Table 5.2 summarizes the minimum parking standard calculations.

TABLE 5.2: OTHER JURISDICTIONS

| Municipality | Land Use |  | Parking Rate | Parking Required | Town of Milton Requirements | Difference in Parking <br> Requirements |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Town of Oakville (North Oakville) | Apartment Buildings <br> 4 Storey Plus <br> Visitor <br> Total | $\begin{array}{r} 276 \\ 276 \\ \hline \end{array}$ | Up to 1.25 spaces per unit (maximum permitted) <br> 0.20 spaces per unit <br> 1.45 spaces per unit | $\begin{array}{r} 345.0 \\ 55.2 \\ 400.2 \end{array}$ | $\begin{array}{r} 414.0 \\ 69.0 \\ 483.0 \end{array}$ | -69 <br> -14 <br> -83 |
| City of Burlington (City Wide Parking Standards Review) | Apartment Buildings <br> One Bedroom <br> Two Bedroom <br> Three Bedroom <br> Visitor <br> Total | $\begin{array}{r} 133 \\ 137 \\ 6 \\ 276 \\ \hline \end{array}$ | 1.00 space per unit 1.25 spaces per unit 1.50 spaces per unit 0.25 spaces per unit 1.38 spaces per unit | $\begin{array}{r} 133.0 \\ 171.3 \\ 9.0 \\ 69.0 \\ 382.3 \end{array}$ | $\begin{array}{r} 414.0 \\ \\ 69.0 \\ 483.0 \\ \hline \end{array}$ | $\begin{array}{r} -100.8 \\ 0 \\ -101 \\ \hline \end{array}$ |

### 5.4 Proxy Parking Demand

To better understand actual parking demand that is being generated by apartment buildings in the Town of Milton, and to provide further support that the proposed supply of 1.39 spaces per unit will not result in a shortfall of parking, parking data for residential buildings was compiled from parking utilization surveys competed for a typical multi-family building. It is noted that a comparable site could not be located within the immediate study area given the low-density of the surrounding uses, thus a broader area within the Town was utilized.

Available information about each site, such as the number of units, walking distance to the nearest GO Station, peak parking demand and demand rates is outlined in Table 5.3. Parking surveys are provided in Appendix G.

TABLE 5.3: RESIDENTIAL PARKING SURVEY RESULTS

| Municipality | Address | Distance to Rail Station | $\begin{aligned} & \text { Number } \\ & \text { of } \\ & \text { Storeys }\end{aligned}$ | Number of Units | Type | Demand |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | Peak Parking Demand | Rater Per Unit |
| Milton | 33 Whitmer Street | 3.0 Km (GO Milton) | 6 | 148 | Resident | 125 | 0.84 |
|  |  |  |  |  | Visitor | 29 | 0.20 |
|  |  |  |  |  | Total | 154 | 1.04 |
| Milton | 640-650 SauveStreet | 4.0 km (GO Milton) | 5 | 350 | Resident | - | - |
|  |  |  |  |  | Visitor | - | - |
|  |  |  |  |  | Total | 497 | 1.42 |

It should be noted that the proposed development is located within 5.2 km of the Milton GO Station and is within a similar distance as the residential sites surveyed.

Parking demand rates ranged from 1.04 to 1.42 spaces per unit with an average of 1.23 spaces per unit. The proxy data indicates the developments generate well less than 1.75 parking space per unit as stipulated by the Zoning requirements.

### 5.5 ITE Parking Generation

The Institute of Transportation Engineers (ITE) produces a periodic report titled Parking Generation, which is the prevailing national standard in determining parking demand for a development. ITE standards are based on parking demand studies submitted to ITE by a variety of parties, including public agencies, developers and consulting firms. The most recent parking generation manual available is the 5th edition ${ }^{9}$ and is a comparative starting point to determine baseline assumptions.

This study includes ITE peak period parking demand rates as guidelines to benchmark how the proposed supply compares to Multi-Family (High-Rise) developments. The following ITE Land Use Code (LUC) was reviewed:

- LUC 221 - Multi-family Housing (Mid-Rise): Mid-rise multifamily housing includes apartments, townhouses, and condominiums located within the same building with at least three other dwelling units and with between three and 10 levels (floors) of residence. The weekday peak parking demand ratio is 1.31 per unit.

### 5.6 Projected Demand

A summary of the peak parking demand expected for the proposed development based on the varied methodologies is provided in Table 5.3. The following summarizes the parking demand rates utilized:

- The surveyed parking demand suggested that mid-rise sites within the Town of Milton observed a peak parking demand of 1.23 spaces per unit.
- The ITE parking demand rates suggest that mid-rise sites were observed with a peak parking demand of 1.31 spaces per unit.

The projected demand is forecast to be in the order of 362 spaces.
TABLE 5.4: PROJECTED PARKING DEMAND

| Methodology | Units | Parking Rate | Projected <br> Demand |
| :--- | :---: | :---: | :---: |
| Proxy Parking Demand | 276 | 1.23 spaces per unit | 339.5 |
| ITE Parking Demand | 276 | 1.31 spaces per unit | 361.6 |

[^6]
### 5.7 Bicycle Parking

The site plan statistics indicates a total of 55 bicycle parking spaces are to be provided. A review of the Town's Zoning By-law stipulates that the development be required to provide bicycle parking at a rate of 0.20 spaces per dwelling unit. Based on these requirements, the proposed development meets the Town's zoning requirement.

While the location of the bicycle parking is not shown in the site plan at this time, bicycle parking for residents (long term) should be located in the underground parking garage or the main level. Space should also be considered for bicycle repairs and cleaning, if feasible.

## 6 Transportation Demand Management

The goal of a Transportation Demand Management (TDM) plan is to reduce the development's overall traffic and parking impacts through the implementation of strategies that are aimed at affecting the demand side of the transportation equation, rather than the supply side. By their very nature, TDM programs attempt to change people's behavior, and to be successful, they must rely on incentives or disincentives to makeshifts in behavior attractive to the commuter.

TDM strategies include financial incentives, time incentives, the provision of new or enhanced commuter services, dissemination of information, and marketing alternative services. TDM strategies include all the incentives and disincentives that increase the likelihood for people to change their existing travel behavior.

The TDM plan has been formulated to extent reasonable and practical strategies that encourage residents and visitors to take alternative modes of transportation. The strategies identified are expected to improve transportation access and connectivity within the development, as well as to the reset of the study area. For each strategy, an explanation of the is provided, as well as a description of what the applicant is proposing to provide.

### 6.1 Mode Split

The use and reliance on non-auto modes is an important consideration in assessing appropriate TDM strategies. Details on an area's mode split can help provide insight on how and what to improve to shift reliance from personal vehicles. To determine the area surrounding the subject site's existing mode split, information on primary modes of transportation for all home to work based trips was extracted from the 2016 Transportation Tomorrow Survey (TTS). Traffic zones within the study area have been included to determine a representative mode split for the immediate area. The detailed mode of travel summary is provided in Table 6.1.

TABLE 6.1: 2016 TTS MODAL SPLIT (TZ 4104,4107)

| Modes of Travel | Study Area |
| :---: | :---: |
| Walk | $0.0 \%$ |
| Vehicle (Driver) | $70.8 \%$ |
| Vehicle (Passenger) | $13.5 \%$ |
| Transit | $15.8 \%$ |
| Cycle | $0.0 \%$ |
| Total | $100.0 \%$ |
| Sustainable Modal Split (Transit/Walk/Cycle) | $\mathbf{1 5 . 8 \%}$ |

Sustainable modes of travel within the immediate area based on 2016 TTS data suggests that $16 \%$ of trips are completed by non-automotive means. Transit is noted to make up all of these trips, with $43 \%$ of transit users utilizing GO Rail without any joint connection through Milton Transit. This indicates that a portion of transit users are using their automobile to complete the first and last mile of their trip in Milton.

A major contributing factor to the high number of trips made by vehicles within Milton as opposed to walking and cycling is due to the suburban nature of land use and low-density residential uses of the immediate area.

### 6.2 Through Design

Supporting land-use/infrastructure that encourage people to choose travel modes other than driving alone are a number of factors that influence peoples' travel mode choices. These strategies are already accounted for through the developments overall design and include the following.

### 6.2.1 Pedestrian Facilities

Accessibility to and from a development is essential in helping to ensure that those that can walk, do. Proper pedestrian connections from the surrounding community to the development should be constructed to ensure safety and to enhance the overall pedestrian experience.

Walking is encouraged by the provision of a pedestrian-friendly site layout that features an extensive network of sidewalks and entrances at key points both within the site and connecting to the existing pedestrian network. The majority of the site is provided with direct public access for pedestrians via two street level entrances from Regional Road 25 and Louis Saint Laurent Avenue. This is intended to provide a comprehensive network of pedestrian connections to allow for an enhanced pedestrian experience for all users of the site.

By taking advantage of the future public sidewalk network to attract and serve pedestrians, combined with multiple pedestrian connections within the site, the development offers walkability as one of the key design features.

### 6.2.2 Bicycle Facilities

Increasing bicycling to, from and within Milton is a key strategy to reducing vehicle trips. The number of people bicycling is directly related to the quality of the bicycling network and presence of bicycling facilities.

As outlined in Section 2.3, the site is adequately served by bicycle infrastructure such as the on-street cycle lanes on Louis Saint Laurent Avenue and the asphalt multi-use trails on both Regional Road 25 and Louis Saint Laurent Avenue.

### 6.2.3 Secure Bicycle Parking

Commuting by bicycle can be a significant financial investment for many making even a small chance of bicycle theft enough of a reason to choose another mode of transport. As a result, it is important to that the development provide adequate and appropriate bicycle parking options so that cyclists can feel comfortable leaving their bicycle for extended periods of time.

To promote and help in achieving a greater reliance on bicycle travel, the development proposes to adopt the following cycling-oriented strategies:

- Provision of at least 55 indoor bicycle parking spaces located within the underground parking garage for use by residents;
- Provision of outdoor bicycle racks located adjacent to the main entrances to provide adequate and secure bicycle parking for visitors, if feasible;
- Monitor and evaluate cycling use as required with potential to increase bicycle parking based on demand.

With the proposed bicycle parking spaces, residents and visitors are more likely to choose to travel to/from the site by cycling. This increase in sustainable transportation helps to create a reduction of automobile trips and thus a reduction in vehicle parking demand.

### 6.2.4 Transit

The subject site is currently served by Milton Transit Route 9. This route operates by connecting residential neighbourhoods with the Milton GO Station. Headways are on the order of 60 minutes during most service hours, with shorter headways provided during peak hour services.

Creating a transit improvement plan focused on improvements tailored to the needs to improve speed, reliability, comfort and accessibility of transit service is recommended to be undertaken by Milton Transit to improve first and last mile trips by local municipal transit use. Some initiatives that could be considered include:

- Expanded service
- New shelters (weather protected waiting and sitting area);
- Improved signage posted route;
- Electronic scheduling information;
- On-street transit priority measures;
- Improved headways;
- Wired Smart bus stations (Wi-Fi, USB ports).

At the development level, direct links connecting residents and visitor to nearby bus stops are planned to be provided as part of the overall design
scheme making the development area more navigable towards local bus stops.

### 6.3 Proposed Strategies

The proposed strategies identified herein will be implemented by the applicant to reduce the number of auto-trips made to/from the development:

### 6.3.1 Transportation Information

The applicant should consider developing marketing/informational materials as part of their initial scope of work. Information on transportation options and/or links to the appropriate website should be conveyed to all prospective residents as a component of a resident welcome packet.

Available information should include schedules for local and regional transit services, bicycle and trail networks and the location of retail and recreational establishments.

### 6.3.2 Parking

Sufficient automobile parking is necessary for the development to be successful. However, too much parking can encourage traffic congestion, limit the ability to meet trip reduction goals, increase project costs, and impact site design and aesthetics can discourage the use of other modes. Finding the right balance needed to support the Towns' goals is critical, particularly, given that parking is an expensive resource.

The role of parking management is also a key element to helping Milton meet its trip reduction goals. If free and unregulated parking is provided, there is little incentive for many residents and visitors to use alternative modes of transportation.

Free and abundant parking encourages people to drive alone rather than car or van pool, be dropped off or picked up, walk, cycle or take transit. When too much parking is provided, and is provided free of cost to the user, the use of alternative sustainable modes is put at a substantial disadvantage.

At the same time however, the uses proposed on the site require a certain amount of base parking supply in order to be successful. Per the current development plan, 404 parking spaces ( 383 spaces plus 21 tandem spaces) are provided for the 276 residential units whereas the Zoning requirements stipulate 483 parking spaces are required.

Based on the imperial data collected as part of this study, it is evident that parking demand at typical apartments are significantly lower than the rates stipulated in the Town's Zoning By-law and suggest a parking supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) is sufficient for the development.

As the development promotes the use of other modes of transportation through reduced on-site parking that will meet the projected demand, the development plays a significant role in setting an example for residents and visitors to consider non-automotive travel.

The parking management strategy is designed to help ensure there are enough parking spaces to support the site, while avoiding an over abundance of parking supply. Balancing these factors should help achieve trip reduction goals, reduce development costs, and support the success of a pedestrian friendly development.

### 6.4 Optional Strategies

In addition to the strategies above, the applicant may wish to implement more strategies. The following strategies are strictly optional, and the applicant should weigh each carefully before implementing to both ensure it is costeffective and does not adversely impact the overall community (such as parking spillover).

### 6.4.1 On-Site Bicycle Repair Facilities

Providing basic tools for keeping bicycles in good working order can encourage residents and commuters to try biking and keep them riding. Bicycle repair facilities, such as hand tools and an air compressor for tires, are a small investment that can keep bicycles in circulation and maximize bicycle trips.

Do-it-yourself bicycle repair stands could be provided, including tire gauges, air pumps, wrenches and other tools for minor repairs. At a minimum, a repair facility should be located within the underground parking garage for use by residents.

### 6.4.2 Unbundled Parking

Implementing a paid-parking operation is one of the most effective TDM strategies for encouraging alternative travel habits. To further encourage residents of the apartment building to utilize sustainable travel modes, the development could lease parking spaces separately from the cost to rent a unit. This is more equitable and efficient, since occupants are not forced to pay for parking they do not need and allows consumers to adjust their parking supply to reflect their needs.

This is an important factor as residents are notified at the onset of the project that parking is proposed to be provided as an additional cost in lieu of the price to rent a unit. If residents are significantly considering changing their travel behaviour, the cost of renting a parking space could be a contributing factor to this change.

### 6.4.3 Presto Pass

To create a climate in which sustainable transportation is considered "the norm", an incentive could be included for residents. Given the desire to create an environment where sustainable transportation options are the norm, the development could consider providing all residents with a preloaded presto with a nominal amount of at least $\$ 10$ dollars. This would help create and establish a culture of transit use amongst the development.

### 6.4.4 Live Transit Information

Live transit information, such as next scheduled departure for transit vehicles and applicable GO Transit routes at Milton GO Station, can be permanently displayed in a central location such as the lobby of the apartment building.

Displaying this information in this location allows passengers to time their trips appropriately and stay in a climate-controlled area during times of severe weather.

### 6.5 Projected Trip Reductions

The Town of Milton recommended the use of the City of Kitchener's TDM Checklist to identify projected trip reductions by including certain TDM measures. Appendix H contains the City of Kitchener's TDM checklist.

Taking into consideration the parking reductions as outlined in the City of Kitchener checklists, the proposed TDM measures proposed by the development results in a parking reduction of 53 resulting in a parking supply of 430 parking spaces. The TDM measures provided are as follows:

- Active uses at grade along street frontages
(4 parking space reduction) City of Kitchener
- Building owner will provide subsidized presto passes
(2 parking space reduction - Partial Credit) City of Kitchener
- Building owner will charge parking as a separate cost to occupants (47 parking space reduction) City of Kitchener

Increasing awareness of sustainable transportation opportunities for residents can assist in lowering the site's parking demand and ultimately the site's transportation impacts. General education of all modes of transportation, including their benefits and how to make the best use of them, are a key component to TDM success.

### 6.5.1 Parking Supply

One of the most important TDM measures that is not provided with a mechanism for trip reduction and parking reduction is the parking supply. This measure is one of the most effective TDM measure available. Recent
research indicates that an area with more parking influences a higher demand for more automobile use.

A New York City study of three boroughs showed a clear relationship between guaranteed vehicular parking at home and a greater tendency to use the automobile for trips made to and from work, even when both work and home are well served by transit. The study infers that driving to other non-work activities is also likely to be higher for households with guaranteed vehicular parking ${ }^{10}$.

A study of households within a two mile radius of ten rail stations in New Jersey concluded that if development near transit stations is developed with a high parking supply, then those developments will not reduce automobile use compared to developments located further away from transit stations, and that parking supply can undermine the incentive to use transit that proximity to transit provides ${ }^{11}$.

A study of nine cities across the United States looked at the question of whether citywide changes in vehicular parking cause automobile use to increase, or whether minimum parking requirements an appropriate response the already rising automobile use. The study concluded that: "parking provision in cities is a likely cause of increased driving among residents and employees in those places". ${ }^{12}$

To reiterate, many existing Zoning By-Law parking requirements are antiquated and require updating to conform and reflect current polices and best practices. Many municipalities recognize this and are updating parking requirements based on parking surveys and inter-jurisdictional review.

As outlined in Section 5.3, other municipalities recognize this and have reduced the parking requirements to be reflective of best practices based on a number of methodologies. To reiterate, the Town of Milton requires on average $\mathbf{2 3 \%}$ more parking to be provided for this development than would be required by the Town of Oakville and City of Burlington that have adopted new parking requirements. With the incorporation of unbundled parking spaces, the proposed supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces); would be considered appropriate for the adjacent municipalities.

[^7]
### 6.6 Proposed Monitoring \& Evaluation

### 6.6.1 Cycling

It is recommended that the operator of the site monitor the on-site bicycle parking spaces to ensure demand matches supply. An indicator to suggest that the site's bicycle parking demand is exceeding supply is observing bicycles locked to the street furniture on-site or immediately adjacent to the subject site.

Should the site's bicycle parking demand regularly exceed the supply, consideration be given to expanding the amount of on-site bicycle parking provided.

### 6.6.2 Walking

It is recommended that the operator of the site monitor the long-term desire lines, if any, created by the erosion caused by pedestrians crossing the site's landscaped areas. Should desire lines form there may be an opportunity to adjust the site's landscaping to encourage use of the designated on-site pedestrian sidewalks.

## 7 Conclusions and Recommendations

### 7.1 Conclusions

## Transportation Impact Study

This study evaluated the impacts associated within the construction of 276 residential units in three 6-storey buildings on a parcel of land bounded by Regional Road 25 north of Louis Saint Laurent. Access to the site is proposed via two right-in/right-out driveway to Regional Road 25 and Louis Saint Laurent Avenue. Overall the proposed development is projected to generate approximately 99 new vehicle trips during the weekday AM peak hour and 119 new vehicle trips during the weekday PM peak hour.

Detailed traffic analysis was conducted for each of the study area intersections under Base conditions, 2024, and 2029 Background and Total conditions.

The new traffic forecast to be added by full-build out of the development to the study area roadways results in relatively small impacts at the various study intersections. The analysis has further determined that the proposed driveways to Regional Road 25 and Louis Saint Laurent Avenue will operate at LOS C or better during the weekday peak periods under the 2024 and 2029 Total conditions.

With the proposed development having access through a right in/out driveway to Regional Road 25, it is suggested that a northbound right turn taper be constructed to allow right-turning traffic to safely slow down before making the turn from the higher speed roadway, without interfering with through traffic on Regional Road 25.

It is acknowledged that deficiencies currently exist at the Regional Road 25 and Louis Saint Laurent intersection and they can be expected to persist in the future with anticipated growth in traffic, independent of the development. As outlined in the capacity analysis summary tables, impacts to peak hour operations at the intersection of Regional Road 25 at Louis Saint Laurent Avenue between future background and total traffic conditions are expected to be relatively minor as a result of the proposed development. As a result, there are no recommended improvements at Regional Road 25 and Louis Saint Laurent Avenue necessary to accommodate the proposed development.

## Parking Study

The proposed site provides for a total of 404 parking spaces ( 383 spaces plus 21 tandem spaces); equating to a parking rate of 1.39 parking spaces per unit (resident and visitor). The parking requirement under Zoning By-Law 2009-189 stipulates a parking supply of 483 spaces; equating to a parking rate of 1.75 spaces per unit (resident and visitor). The proposed parking supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) does not
meet the Zoning requirements as a shortfall of 100 spaces is noted, however, the 1.75 spaces per unit is much higher than many comparable municipalities.

To provide further support that the proposed supply of 1.39 spaces per unit will not result in a shortfall of parking, projected peak parking demand for the site has been estimated based on compiled parking surveys as well as industry standard rates contained within the ITE Parking Generation. Based on these methodologies, forecast parking demand for the proposed development is projected to be 362 parking spaces ( 1.31 spaces per unit).

Many existing Zoning By-Law parking requirements are antiquated and require updating to conform and reflect current polices and best practices. Many municipalities recognize the oversupply of parking and are updating the zoning requirement to reflect. Key municipalities that have recognized this include Town of Oakville, City of Burlington, and City of Kitchener. These municipalities have undertaken a comprehensive review of parking requirements and recognized that changes are required to meet policy objectives.

The Town of Milton requires on average $\mathbf{2 3} \%$ more parking to be provided for this development than would be required by the City of Burlington or Town of Oakville that have adopted new parking requirements. Through the incorporation of unbundled parking spaces, the proposed supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) is sufficient.

The transition from an automobile-dependent environment to one that is transit-supportive will require strategies to assist in shifting modal split and enabling the emergence of a more pedestrian-friendly transit-supportive environment. The over provision of free or low-cost parking creates areas that are dominated by parking infrastructure can have a negative impact on ridership and the pedestrian environment as well as providing an incentive for single-occupant vehicle use.

Based upon the recent research and best practices being implemented by municipalities, a reduced Parking Supply is one of the most effective TDM measure available to reduce vehicle travel. The role of parking management is a key element to helping Milton meet its trip reduction goals. If free and unregulated parking is provided, there is little incentive for many residents and visitors to use alternative modes of transportation.

Overall, the forecasted demand provides a statistically valid justification that the proposed parking supply of 404 parking spaces ( 383 spaces plus 21 tandem spaces) is sufficient for the proposed development program.

## Travel Demand Management

The site plan proposes several TDM measures that include:

- Sidewalk connections linking the building's primary entrance to the municipal roadway along Louis Saint Laurent Avenue and Regional Road 25 are proposed;
- Minimum bicycle parking spaces are provided based on the Town's Zoning requirement; and
- Convenient access to the existing transit network is provided with transit stops located at the intersection of Regional Road 25 and Louis Saint Laurent Avenue.

Additional measures that are currently not included on the site plan that could be considered to further help promote and encourage TDM include:

- Milton Transit to upgrade the existing transit stops with concrete landing pads and shelters.
- The applicant consider providing preloaded presto passes to residents.
- The site operator monitor the on-site bicycle parking supply to ensure and appropriate amount of bicycle parking is provided.
- The site operator monitor the long-term desire lines, if any, created by the erosion caused by pedestrians crossing the site's landscaped areas. Should desire lines form there may be an opportunity to adjust the site's landscaping to encourage use of the designated on-site pedestrian sidewalks.
- Based on the City of Kitchener's TDM Checklist, a potential reduction of 53 parking spaces could be realized with the additional measures incorporated.

### 7.2 Recommendations

Based on the findings of this study, it is recommended that:

- That the Region of Halton and Town of Milton monitor the future traffic volumes at the intersection of Regional Road 25 and Louis Saint Laurent Avenue when they Boyne Secondary Plan area is built out to confirm the lane geometry and signal timing phases; and
- A northbound right turn taper be provided along Regional Road 25 at the proposed driveway to provide a safe right-turn maneuver based on the potential for higher speeds on Regional Road 25.
- Flexible delineators (to act as a median) be installed by the Applicant on Regional Road 25 extending from the Louis Saint Laurent Avenue intersection to 45 metres north of the proposed Site Driveway to prohibit left-turns in and out of the site.

| Attachments: | Derry at RR25 TIS Report - Site Traffic.pdf |

Hi Andrew,

Thanks for providing the proposed Terms of Reference for the Transportation Impact Study.

Proposed Transportation Impact Study Terms of Reference

Transportation Planning at the Region have reviewed the Terms of Reference provided below and offer the following comments:

## Study Area

- The proposed study area is acceptable, however the study area may need to be expanded upon review of the results of the study.

## Scenarios

- Please consider a 5 and 10 year (AM+PM) scenario.
- The Region's Road Capital Plan includes the widening of Regional Road 25 to 6 lanes from Britannia Road to Derry Road, construction is currently planned to start in 2027.

## Background Growth

## 5 Year Growth

- This parcel is located in close proximity to the Boyne Secondary Plan area. The growth is expected at Regional Road 25 and Louis St Laurent as a result of the development of the Boyne Secondary Plan lands. Please consider the following Boyne Area "site traffic" growth volume expected at Regional Road 25 and Louis St Laurent intersection in the PM period. Please reverse these volumes in the AM Peak Period.

## RR25 @ LSL

| EBL | 80 |
| :---: | :---: |
| EBT | 336 |
| EBR | 160 |
| WBL | 99 |
| WBT | 287 |
| WBR | 83 |
| NBL | 199 |
| NBT | 260 |

| NBR | 75 |
| :---: | ---: |
| SBL | 125 |
| SBT | 647 |
| SBR | 175 |

- In addition please consider the site traffic from a development north of this study area at the Regional Road 25 and Louis St. Laurent intersection (see attached Site Traffic figure).

## 10 Year Growth

- Please consider a 2\% Compounded annually growth rate to the 5 year volume forecast (2024 to 2029).

## Access to Regional Road 25

- Access spacing is required to conform to the Regional Access Management Guidelines and subject to the completion of the Transportation Impact Study. The Access Management Guidelines are available on-line at http://old.halton.ca/common/pages/UserFile.aspx?fileld=136320. The Halton Region Access Management Guidelines are supported by an Access Management by-law 32-17.
- It should be noted that due to insufficient spacing, the Region will not consider a full movement access from this property directly from Regional Road 25.

In addition, the above noted By-law indicates that "access to a Regional road from private property shall be permitted only where such access is necessary because access to a local road is not feasible;". Should the Transportation Impact Study demonstrate that an access to Regional Road 25 is necessary, a right-in right-out access will be considered.

As per the Halton Region Access Management Guidelines, a concrete centre median extension would be required to physically restrict access to right-in right-out, extending 45 m north and south of the access curb returns. Should this design not be possible due to conflicts with an adjacent access, a "pork chop" centre median will also be required.

- Should an access to both Louis St Laurent and Regional Rad 25 be proposed, the Transportation Study should also consider the potential "cut through" traffic born by the proposed development configuration.

Kind Regards,
Patrick

Subject: (190334) 6349 Regional Road 25 (West Site), Town of Milton - Scope of Work
Greetings,
Paradigm has been retained to undertake a Transportation Impact Assessment (TIA), Parking Study (PS), Access \& Circulation Review (ACR) and a Pavement Marking and Signage Plan (PMS) for 6349 Regional Road 25 (West Site) in the Town of Milton.

The subject site is located within the northeast corner of Regional Road 25 and Louis Saint Laurent Avenue in the Town of Milton. The property owner is proposing to construct four (4) building pads varying from one (1) to six (6) storeys with a total of 270 residential units. Vehicle access is proposed
via a driveway connection to Regional Road 25 and Louis Saint Laurent Avenue. A total parking supply of 405 spaces is proposed. This supply does not meet the Town of Milton's zoning requirements as currently planned.

Below is our scope of work for your review and comments.
A Transportation Impact Assessment (TIA) to evaluate the effects of the proposed development on the transportation system and recommend improvements, if necessary, to address potential impacts. The study will follow the Town of Milton Transportation Impact Study Guidelines (2014) and Halton Region Transportation Impact Study Guidelines (2015). The study area will comprise the following one (1) intersection:

- Regional Road 25 at Louis Saint Laurent Avenue (signalized);
- Up to two (2) site driveways

Traffic forecasts and analysis will be completed for one (1) planning horizons (five (5) years from the date the study is commissioned) and two (2) analysis periods (weekday AM and PM peak hours).
We will conduct eight (8) hour turning movement and classification counts (7:00 to 10:00 AM, 11:30 AM to 1:30 PM, and 4:00 to 7:00 PM) at the study area intersections.
We will prepare vehicle traffic forecasts for each planning horizon and analysis period. The components of the forecasts are as follows:

- Existing 2019 volumes will be derived from the traffic counts;
- Future Background volumes for the remaining horizon years will be estimated by applying a growth rate to the Existing volumes and adding anticipated trips from nearby approved and in-stream developments.
Growth rates and developments to include in the background traffic forecasts will be provided/confirmed by the Town/Region; The Town has discussed the required background growth rates \& developments with Halton Region. The Region has advised that they will be providing this information in their scope of work comments.
- Vehicle trips generated by the proposed development will be forecast based on the rates contained in the Institute of Transportation Engineers (ITE) Trip Generation Manual (10th Edition). These trips will be distributed and assigned to the study area intersections based on existing traffic patterns and Transportation Tomorrow Survey data. The resulting net site-generated traffic will be added to the Future Background estimates to produce Future Total volumes for each future horizon year and analysis period.
We will analyze the operation of the study area intersections for the Existing, Future Background (without the development) and Future Total (with the development) traffic conditions for each horizon year and analysis period using Synchro software. Volume-to-capacity (v/c) ratios, Level of Service (LOS) and queuing will be assessed.
Based on the analysis results, we will identify any operational deficiencies as well as the net impact of the proposed development on the study area road network. The need for road improvements (e.g., auxiliary turn lanes) and/or other mitigating measures (e.g., traffic control device modifications) to address deficiencies will be determined. We will assess whether these measures are required due to non-site traffic (i.e. Existing or Future Background) or the increase in volumes resulting from the proposed development (i.e. Future Total).
We will explore opportunities to reduce vehicular traffic volumes generated by the proposed development through non-auto mode

A Parking Study (PS) to estimate the parking demand generated by the proposed development and establish the number of on-site parking spaces that should be provided, recognizing site constraints and local conditions. If needed, a strategy would be developed to satisfy the parking demands of the proposed development.
We will conduct proxy site surveys at two (2) locations to collect parking generation data specific to the proposed land uses. The surveys will be undertaken from 7:00 PM to 3:00 AM on one (1) typical weekday at sites with similar characteristics as the proposed development. The locations, dates and times to be surveyed will be provided/confirmed by the Town. The study must outline the similarities between the proxy sites and the proposed site and why they will generate a similar parking demand. The selection and justification of the survey sites is the responsibility of the consultant. The proxy sites must be located within Milton, or alternatively, Oakville or Burlington.
We will calculate parking generation rates for the proposed land use from the proxy site survey data collected in Task 1. The derived rates will be compared to data cited in the Institute of Transportation Engineers (ITE) Parking Generation ( $5^{\text {th }}$ Edition) and other available information to confirm their validity. Data from the ITE reference document may be used instead of the proxy site rates if determined to be more appropriate for the proposed land use.
We will calculate the parking supply required for the proposed development by the municipal zoning by-law. If the planned parking supply does not meet the by-law requirement, we will forecast peak parking demand based on the rates developed. This forecast will be further refined through consideration of typical auto ownership characteristics.
If the planned parking supply for the proposed development will adequately serve the forecast peak demand, we will provide a justification for the proposed number of spaces, recognizing site constraints, local conditions and potential spillover impacts. If not, we will identify parking management measures that could be considered to alleviate the projected supply deficit (e.g., transit, active transportation, TDM strategies, shared parking). This may include use of legal onstreet and off-site parking nearby.
A comprehensive TDM plan using the City of Kitchener's TDM Checklist (see attached) is required. Through the proposed TDM checklist measures, it must be ensured that the resultant parking requirement in Table $\mathbf{C}$ is less than or equal to the proposed parking supply. All proposed TDM measures must be included in the recommendation section of the report.
An Access and Circulation Review (ACR) to ensure compliance of the proposed development plan with review agency requirements and applicable industry guidelines.
We will review the site access and circulation design to ensure compliance with review agency requirements and applicable industry guidelines. The analysis will be completed using AutoTURN and include assessments of vehicle access and egress, clearance and swept path manoeuvres within the site based on a suitable design vehicle (e.g. fire truck, garbage truck) to identify potential conflicts with the site driveways, circulation aisles, loading areas and/or parking layout (i.e. no "dead end" spaces). Recommended design changes resulting from the assessment will be provided to the client (or its agents) for consideration. Please also confirm that two PTAC design vehicles can simultaneously navigate the underground parking ramp without striking.
We will determine sight distance requirements following applicable review agency and industry guidelines and assess compliance based on field measurements. If the sight distance available does not meet the minimum requirement, mitigating measures will be identified.
We will review the concept plans to assess the design and operation of the proposed accesses and internal roadways. This includes the adequacy of sight lines, spacing and location of the the access meets all OPSD 350.010 and TAC requirements.
A Pavement Marking and Signage Plan (PMP) to illustrate the locations and details of all signs and pavement markings on site. - We would like to defer this until the Site Plan Approvals stage of the development - Can be deferred to site plan stage

The site design appears to be conducive to traffic infiltration / cut-through traffic. Please evaluate this concern and make recommendations to mitigate the potential issue (e.g. significant traffic calming measures throughout the internal roadways of the site)

Detailed Recommendations regarding on-site/off-site roadway improvements, site access, site circulation, and TDM measures are to be made.

Please be advised that the Louis St. Laurent Avenue site access right-in, right-out "porkchop" island shown on the concept plan is essentially redundant as there is an existing raised concrete concrete median along this section of Louis St. Laurent Avenue. The porkchop island should be removed from the proposed design. The centre median on Louis St. Laurent Avenue will remain in place, making the site access a right-in, right-out only access.

Thank you and regards.
Andrew Evans, M.Sc.
Transportation Planner

## Appendix G

## Parking Survey

33 Whitmer Street is that are located within the southeast corner of Main Street West and Whitmer Street in Milton, Ontario. This development is made up of a six-storey buildings with a total of 148 residential units varying from 1 bedroom to 2 bedrooms. There is 149 residential narking snaces and 38 visitor narking snaces.

## Appendix H

## City of Kitchener TDM Checklist

## TABLE A <br> SHARED PARKING REQUIREMENTS

Mixed-use developments may be eligible for parking space reductions based on shared parking ratios between uses. Please fill out the yellow boxes in the table below based on the Zoning By-Law requirements for parking and bicycle parking for your land use(s). Orange boxes will automatically show your results.

| TABLE A1. Zoning By-law Requirements |  |  | TABLE A2. Shared Parking Rate Breakdown |  |  |  |  |  |  |  |

${ }^{\top}$ Note: See Zoning By-Law S. 6 to calculate parking requirement for Plaza / Mixed uses. | ${ }^{\top \pi}$ Note: For further potential reductions, apply individual use rates in Table A1.

| Shared Parking Summary | Yes or No ? | Resultant Parking Required |
| :--- | :--- | :---: |
| Would you like to apply Table A shared rates for a parking reduction? | Yes | 473.0 |

Note: to apply these rates, $100 \%$ of parking must be shared between uses and unassigned. If you would like to use shared parking rates for only a portion of the required parking spaces, you must provide the proposed shared parking rates and applicable reductions in an Implementation Plan or TDM Plan within the TDM Report.

PARTS TDM: City of Kitchener TDM Checklist
TABLE B
OPTIONAL TDM MEASURES
 form, please fill out the yellow boxes in the table below with details about your development proposal. Please refer to the Urban Design Manual for feature design standards

| Measure | Features | Parking Reduction Available | To a Maximum Reduction of |  | Developer Proposes Provision of |  | Maximum Reduction Allowable | Bonusing Points (TBD) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Amount | Unit | Amount | Unit |  |  |
| B1 | Provision of bicycle parking spaces beyond the minimum amount required by the Zoning By-law. | 1 car space reduction per 5 bicycle spaces beyond minimum Zoning By-law requirement. | 10\% | of total parking required |  | Bicycle Spaces beyond minimum required | 0 |  |
| B2 | Non-residential uses: provision of shower and change facilities at an amount of not less than 13 m 2 in equal proportion of male and female facilities (Note: maximum reduction amount calculated based on required bicycle parking). | 2 car space reduction for each additional shower facility provided at (13m2). | 0 | parking space(s) | 0 | m2 of shower / change facilities | 0 |  |
| B3* | Non-residential (office) uses: Provision of 1 car share vehicle and dedicated parking space in a priority location that is publically accessible for a development with at least 25 required parking spaces, and 1 additional car share vehicle and dedicated parking space for every 50 additional required parking spaces. (Note: maximum reduction amount calculated based on required parking). | 4 car space reduction for each car share vehicle and dedicated parking space provided | 0 | parking space(s) | 0 | Non-residential car share vehicle(s) and Space(s) | 0 |  |
|  | Residential uses: Provision of 1 car share vehicle and dedicated parking space in a priority location that is publically accessible unless it is a private shared vehicle for every 75 dwelling units. (Note: maximum reduction amount calculated based on required parking). | 4 car space reduction for each car share vehicle and dedicated parking space provided | 24 | parking space(s) | 0 | Residential car share vehicle(s) and Space(s) | 0 |  |
| B4 | Non-residential uses: Provision of ride share parking spaces in a priority location. | 3 car space reduction for each ride share space provided | 5\% | of total parking required | 0 | Priority Car Pool Spaces | 0 |  |
| B5 | Provision of active uses at-grade along street frontages. | 1\% car space reduction | 1\% | of total parking required | $\checkmark$ Yes | Check "Yes" (left) if you will provide | 4 |  |
| B6* | The building owner/occupant will provide subsidized transit passes for all occupants for a period of two years. | 10\% car space reduction | 10\% | of total parking required | $\square \mathrm{Yes}$ | Check "Yes" (left) if you will provide | 0 |  |
| B7 | Building owner/occupant agrees to charge for parking as a separate cost to occupants. | 10\% car space reduction | 10\% | of total parking required | $\checkmark$ Yes | Check "Yes" (left) if you will provide | 47 |  |
| B8* | Employment Uses: Building owner/occupant agrees to join Travelwise (TMA) that provides ride matching services for car/vanpooling and emergency ride home options. | 10\% car space reduction | 10\% | of total parking required | $\square$ Yes | Check "Yes" (left) if you will provide | 0 |  |
| B9 | Enhanced bus shelters with seating are provided at the transit stop immediately adjacent to the development in consultation with the City of Kitchener and the Region of Waterloo. | Not Applicable for parking reduction | Can only be a consideration | ed to bonusing | $\square$ Yes | Check "Yes" (left) if you will provide | 0 |  |
| B10 | Provide television monitors in visible and accessible locations on site and in adjacent transit stops to allow to City of Kitchener and the Region of Waterloo to display information regarding public transportation. | Not Applicable for parking reduction | Can only be a consideration | ed to bonusing | $\square \mathrm{Yes}$ | Check "Yes" (left) if you will provide | 0 |  |
| B11 | Provision of bicycle self-service station equipped with tools necessary to perform basic repairs and maintenance | Not Applicable for parking reduction | Can only be a consideration | ed to bonusing | $\square$ Yes | Check "Yes" (left) if you will provide | 0 |  |
| B12 | $25 \%$ to $49 \%$ of required parking is located underground or in a structure | Not Applicable for parking reduction | Can only be applied to bonusing consideration |  | $\square$ Yes | Check "Yes" (left) if you will provide | 0 |  |
|  | $50 \%-74 \%$ of required parking is located underground or in a structure |  |  |  | $\square$ Yes | Check "Yes" (left) if you will provide | 0 |  |
|  | A minimum of $75 \%$ of required parking is located underground or in a structure |  | Select only one option (right) |  | $\square$ Yes | Check "Yes" (left) if you will provide | 0 |  |
| B13 | Non-residential use: Implements paid parking system, where price is set greater than the cost of a monthly transit pass, on all or part of the site (e.g. parking permits, paid parking near main entrances, enabled by gate and transponder access, or Pay \& Display stations). | $1 \%$ car space reduction for every $10 \%$ of parking spaces under a paid parking system | 10\% | of total parking required | 0\% | \% of total parking spaces under paid parking system | 0 |  |

 including any ongoing programming or management that may be required for program success.

|  |  |  |  | TABLE D | BONUSING POINT S |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Displayed below are the potential reductions to required parking spaces available based on the amounts entered into Table A and Table B above. |  |  |  | If you achieved a Bonusing Points score greater than X, you may be eligible for bonusing. Please contact City of Kitchener staff for more details. |  |  |
| Original \# P | aces Required: | 473 | 0 | Total Bonusing Points Achieved |  | 0 |

| PERCENT | ON | 11 | \#DIV/0! |  |  |  |

## NEXT STEPS

Thank you for completing the TDM Checklist. Please select whether you would like to apply for a potential parking reduction at the bottom of this page. Refer to the TDM Report Reference Guide for submission requirements to City of Kitchener Staff. If you would like to achieve a greater parking reduction than may be considered through the TDM Checklist, you may develop a TDM Plan as set out in the TDM Report Reference Guide.

Note: If applicable, Parking Reductions for Plaza / Mixed-Use are noted in brown
Would you like to apply Table C rates for a parking reduction?
If you selected No, please submit your completed Checklist to City staff for review

## If you selected Yes, please refer to the TDM Report Reference Guide for submission requirements of an Implementation Plan or TDM Plan.
